Primer on Carbon Credits from Fluorocarbon Emissions Reductions (last revised 5/15/2023)

Reducing fluorocarbon emissions from cooling systems and foam applications is one of the fastest and most cost-effective ways available today to slow global warming. Many such emissions reduction activities can generate revenue through the carbon markets. Under existing methodologies, the following activities may be eligible:

- Commercial refrigeration system retrofits and installations
- Leak detection and reduction in commercial refrigeration systems
- Low Global Warming Potential (GWP) blowing agent usage in foam manufacturing
- Recovery and reclamation of used refrigerants
- Recovery and disposal of refrigerants from stockpiles or equipment
- Recovery and disposal of foam blowing agents from appliances or buildings

See Table 1 for registry and eligibility information, and Table 2 for a full comparison of each methodology.

| American Carbon Registry       | Advanced Refrigeration Systems v2.1, last revised 2021 (link)                      | U.S., Canada, or Mexico                     | Deployment of advanced refrigeration systems in select Large Commercial Refrigeration, Remote Condensing, or Standalone Commercial Refrigeration systems. Both retrofits and new installations may be eligible. | Projects replacing Large Commercial Refrigeration systems must use empirical system-specific data to estimate baseline emissions or use a conservative default rate. Baseline charge sizes range by equipment type. Baseline GWPs range by equipment type and region. | • New refrigeration systems must be approved by the U.S. EPA Significant New Alternatives Policy (SNAP) program to qualify.  
• All ODSs from decommissioned equipment must be recovered and destroyed in accordance with either the ACR or CARB ODS Destruction Methodology. All HFCs from decommissioned equipment must be managed in accordance with EPA regulations.  
• Project must occur within one year.  
• Project is credited for ten years of avoided emissions.  
• Project emissions include future leakage of replacement refrigerants.  
• Default baseline annual leak rates are assumed to be 25.67% for Large Commercial Refrigeration, 12.62% for Remote Condensing Units, and 7.20% for Standalone Commercial Refrigeration. |
| American Carbon Registry       | Certified Reclaimed HFC Refrigerants, Propellants, and Fire Suppressants v2.0, last revised 2022 (link) | U.S., Canada, or Mexico                     | Use of certified reclaimed HFCs to charge existing or newly manufactured refrigeration, air conditioning, aerosol, or fire suppression equipment. | 98% baseline emission rate for all recovered and reclaimed HFCs (i.e. 2% baseline recovery and reclamation rate assumed). | • Excludes CFCs and HCFCs.  
• Project activities include reclamation of material and subsequent sale to a distributor, wholesaler, or end-user.  
• Project must occur within one year, beginning on the date that reclaimed HFCs are first sold.  
• Reclamation must be carried out to AHRI 700 Standards.  
• Point of origin, documentation, and chain of custody required for each specific quantity of HFCs recovered (documentation requirements vary depending on the size of recovery containers).  
• All project emissions are assumed to be negligible. |
| American Carbon Registry       | Destruction of Ozone Depleting Substances and High-GWP Foam v2.0, last revised 2023 (link) | For sourcing material: U.S. or Canada For destruction: anywhere | Destruction of select ODS refrigerants, high-GWP foam blowing agents, and high-GWP insulation foam. Refrigerants may be recovered from equipment or acquired from government stockpiles. | 100% baseline emission rate for all eligible sources. | • Point of origin and chain of custody required for all eligible sources.  
• Project must occur within one year.  
• Destruction facility may be RCRA-approved or meet TEAP screening criteria. Destruction facility must also have all local, state, or federal permits required to destroy ODS.  
• Project emissions do not include replacement gases for destroyed refrigerants.  
• Eligible refrigerants: CFC-11, CFC-12, CFC-13, CFC-113, CFC-114, CFC-115, HCFC-22, HCFC-123. See Methodology Sections 2.2.2-2.2.5 for eligible blowing agents and foam. |

| Climate Action Reserve | Article 5 Ozone Depleting Substances, last revised 2012 (link) | For sourcing material: Article 5 countries For destruction: U.S. | Destruction of select ODS refrigerants, either recovered from equipment or acquired from stockpiles that cannot legally be resold (or can be legally resold but are held by an Article 5 government). Eligible refrigerants must be phased out in their country of origin. | Ten-year baseline emission rate for stockpiled gas that can be legally resold is 94%. Ten-year baseline emission rate for stockpiled gas that cannot be legally resold must be calculated based on leaked quantity between seizure and destruction. | - Project must occur within one year.  
- Project is credited for ten years of avoided emissions.  
- Destruction facility may be RCRA-approved or meet TEAP screening criteria.  
- Destruction facility must also have a Title V air permit, and all other local, state, or federal permits required to destroy ODS.  
- 100% baseline emission rate for refrigerant recovered from equipment.  
- Point of origin and chain of custody required for all eligible sources.  
- Project emissions include future leakage of gases replacing destroyed refrigerants.  
- Eligible refrigerants: CFC-11, CFC-12, CFC-113, CFC-114, CFC-115. |
| Climate Action Reserve | Mexico Halocarbon Protocol, last revised 2021 (link) | Mexico | Destruction of select halocarbon refrigerants. CFC refrigerants from stockpiles or equipment are eligible. HCFC and HFC refrigerants recovered from equipment end-of-life or during equipment retrofitting are eligible, as well as remnants of virgin HCFC-22 or HFC from servicing cylinders. | Baseline emission rate for refrigerant recovered from equipment at end-of-life or from servicing cylinders is 100%. Ten-year baseline emissions rates for gas recovered during equipment retrofitting range from 22% to 83%, depending on species and unit type. Ten-year baseline emissions rate for stockpiles is 65% if the stockpile can be resold (otherwise, it must be calculated based on leakage between seizure and destruction). | - Project must occur within one year.  
- Project is credited for ten years of avoided emissions.  
- HCFC and HFC stockpiles were eligible up until 2022.  
- Point of origin and chain of custody required for all halocarbon sources.  
- Project emissions include future leakage of gases replacing destroyed refrigerants.  
- Destruction facility must be permitted under Mexico’s General Law for the Prevention and Management of Wastes and meet all TEAP screening criteria (in addition to acquiring all required local, state, and federal air or water permits).  
| Verra | Infrared Automatic Refrigerant Leak Detection Efficiency (VM0001) v1.1, last revised 2017 (link) | Anywhere | Installation of infrared automatic leak detection systems in commercial refrigeration systems using HFCs. | Measured annual leak rate from HFC and HCFC equipment to be retrofitted (averaged over three consecutive years). The baseline cannot exceed the latest EPA Green Chill program leak rates. | - Only reductions in HFCs are eligible to be credited.  
- Leak management data should be drawn from equipment owner’s compliance records for ODS refrigerants.  
- Historical and current year leak rates can be calculated using charge sizes and refrigerant refill purchases for each piece of equipment.  
- Revisions to expand eligible leak detection technologies are ongoing. |
| Verra | Recovery and Destruction of Ozone Depleting Substances (VM0016) v1.1, last revised 2017 (link) | Parties to the Montreal Protocol | Destruction of ODS refrigerants and blowing agents (both CFCs and HCFCs). Refrigerants may be recovered or stockpiled gas. Blowing agents must be recovered from end-of-life appliances. | In Article 5 countries, 100% baseline emission rate at equipment end-of-life. Otherwise, uses Climate Action Reserve Protocols default rates (see above). Ten-year baseline emission rate for stockpiled gas is 65%. | - Project is credited for ten years of avoided emissions.  
- In Article 5 countries, assumes 100% venting rates at equipment end-of-life in the absence of regulatory prohibition.  
- Point of origin required for all ODS sources.  
- Destruction facility must have host country permit for ODS destruction and meet TEAP screening criteria.  
- Project emissions include future leakage of gases replacing destroyed refrigerants. |
